

Infrared Vibrational Overtone Spectroscopy of H₂ in MOFs

Outline

- 1) Making H₂ Infrared Active
Polarizability, Quadrupole Moment
- 2) Practical Motivation
Storage, Quantum Sieving, Catalysis
- 3) Overtone Activation-Anharmonicity
Frequency and Intensity (Help!)

Infrared Spectroscopy! Are you crazy?

No Dipole Moment

Polarizability Mechanism

**Interactions with “host”
can induce a dipole moment**

Polarizability Mechanism

Vibrational Transitions Active
Ro-Vibrational Transitions
not very active

H₂ polarizability is effectively isotropic

Quadrupole Mechanism

Unpolarized Atom

Quadrupole Mechanism

Hydrogen Molecule

**Both Vibrations and Ro-vibrations
lead to a changing dipole moment**

Hydrogen Polarizes Atom

Diffuse Reflectance Infrared Spectroscopy

- 1) Long effective optical path length
- 2) Powder sample require no processing
- 3) Typically use 10 mg of powder
- 4) Sample chamber can be quite small

Diffuse Reflectance Spectroscopy: Cryostat Assembly

Rev. Sci. Instr. **77**, 093110 (2006)

Samples are mounted in a glove-box

Quantum Dynamics of Adsorbed H₂

- Vibration

$$E_v = (v + 1/2) \nu_0$$

$$\nu_0 = 4161 \text{ cm}^{-1} \text{ for free H}_2$$

- Rotation

$$E_J = J(J + 1)B_0$$

$$B_0 = 59 \text{ cm}^{-1} \text{ for free H}_2$$

- Translation

Center-of-mass

On the order of 100 cm⁻¹

Spectroscopic notation of possible transitions

- Pure Vibrational modes called Q transitions $\Delta J = 0$
- Q(0) and Q(1) are very close in energy $\sim 6 \text{ cm}^{-1}$ apart
- Rotational Sidebands called S Transitions $\Delta J = 2$

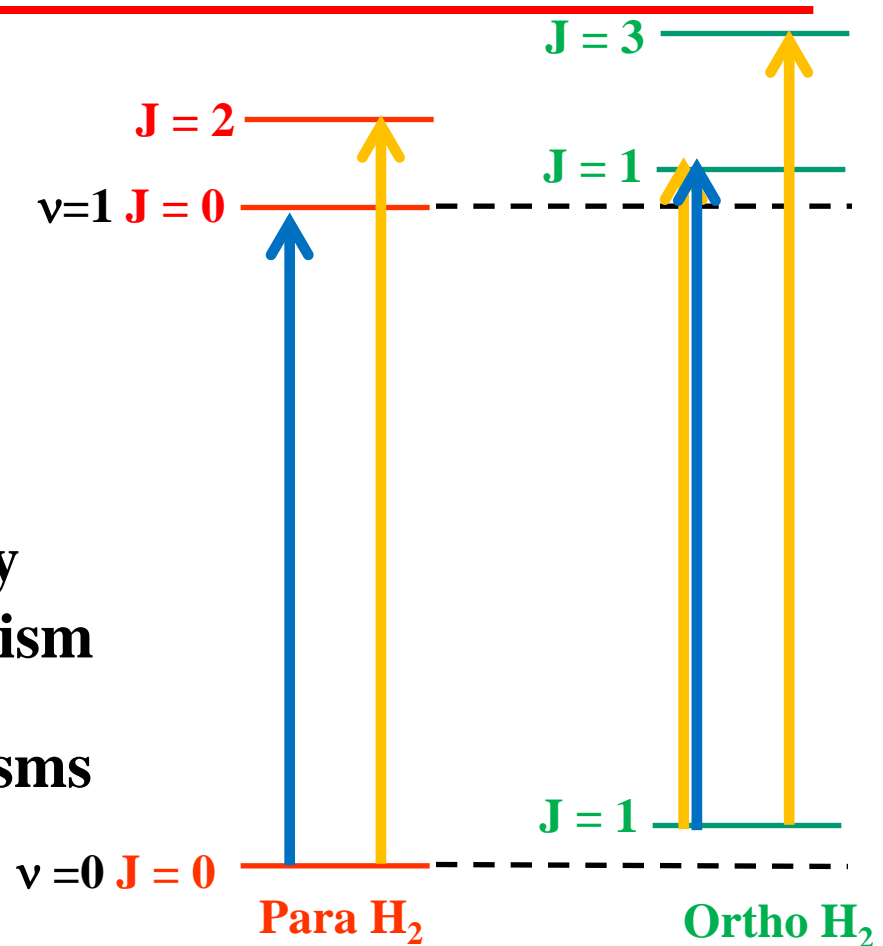

Mechanisms

Because $J = 0$ is spherical
No Quadrupole moment
 $Q(0)$ arises solely from
polarization mechanism

Because polarization is mostly
isotropic S bands dominated by
quadrupole induction mechanism

$Q(1)$ arises from both mechanisms

Typical Spectra for H₂ in MOFs at 30 K

Quantum Dynamics of Adsorbed H₂

- Vibration

$$E_v = (v + 1/2) \nu_0$$

$$\nu_0 = 4161 \text{ cm}^{-1} \text{ for free H}_2$$

- Rotation

$$E_J = J(J + 1)B_0$$

$$B_0 = 59 \text{ cm}^{-1} \text{ for free H}_2$$

- Translation

Center-of-mass

On the order of 150 cm⁻¹

Translational mode energy (quantum sieving?)

Back of the Envelope Calculation

$$ZPE = \frac{3}{2} \hbar \omega$$

$$\omega \approx 200 \text{ cm}^{-1}$$

$$\Rightarrow ZPE = 300 \text{ cm}^{-1} \\ = 420 \text{ K}$$

$$\omega_{D_2} = \frac{1}{\sqrt{2}} \omega_{H_2}$$

$$\Rightarrow ZPE_{D_2} \approx 300 \text{ K}$$

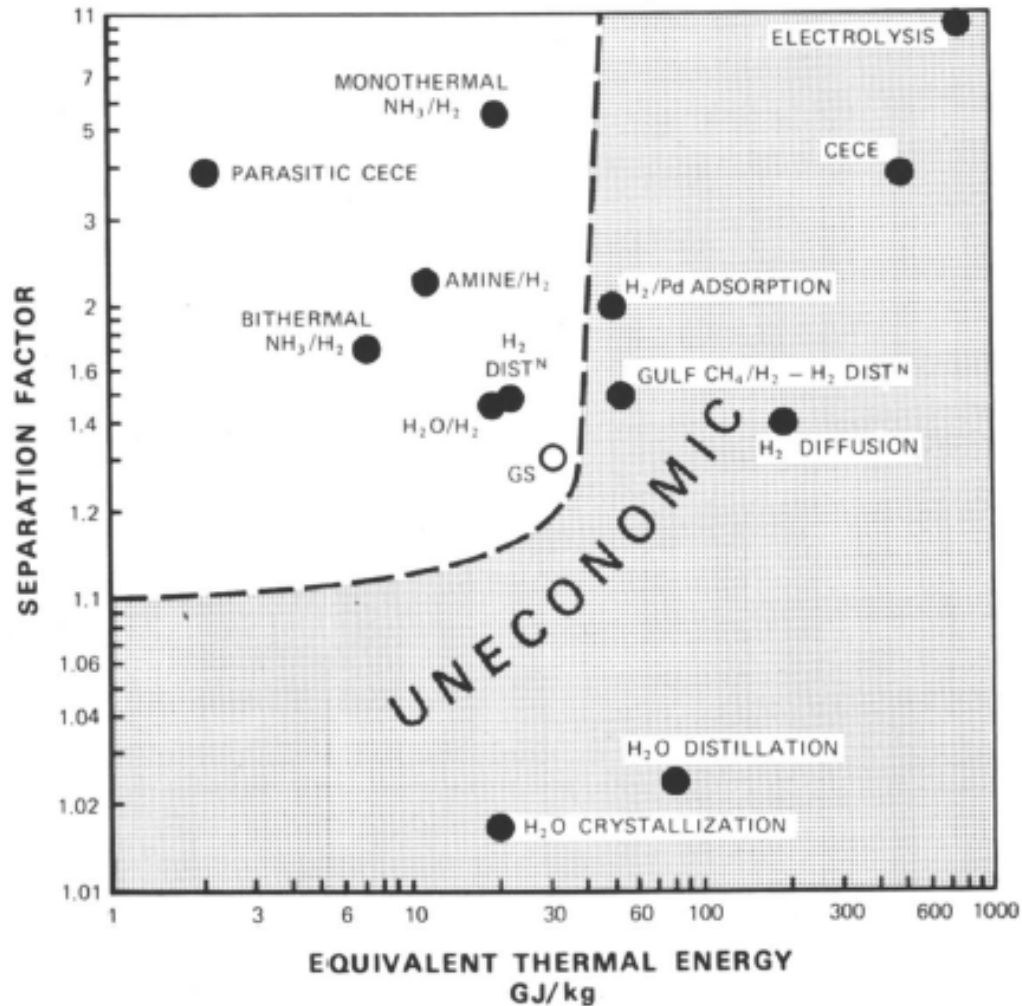

$$\Delta ZPE = 120 \text{ K}$$

$$e^{\Delta E / KT} \text{ at } 77 \text{ K}$$

$$e^{120/77} = 4.75$$

Standard Separation Techniques

Selectivity vs Translational Frequency

J. Am. Chem. Soc.
2013, 135, 9458–9464

Dashed line shows simple back of the envelope
Solid line shows full (harmonic) thermodynamic calculation

H₂ and D₂ Mixtures in Mg-MOF-74

H₂ and D₂ Mixtures (After sitting at room temperature)

Will Overtone show D₂ more Clearly?

MOF-5 Transmission Spectrum

Deuterium in MOF-5

Pure MOF-5

Fundamental

Overtone

Deuterium in MOF-5

Pure MOF-5

MOF-5 with D₂

Fundamental

Overtone

MOF-5 ($Zn_4O(BDC)_3$)

- Each collection of Zn_4O tetrahedra (blue) forms a metal binding site

E. Spencer, J. Howard, G. McIntyre, J. L. C. Rowsell, and O. M. Yaghi, Chem. Commun. 3, 278 (2006).

MOF-5 ($\text{Zn}_4\text{O}(\text{BDC})_3$)

- Each collection of Zn_4O tetrahedra (blue) forms primary binding site
- Hydrogen binds preferentially to this “cup site”

Potential Energy and Frequency Shift

Isolated H_2

$$\rho = \frac{r - r_e}{r_e}$$

$$U_0(\rho) = \frac{hc\omega_e^2}{4B_e} (\rho^2 + a\rho^3 + b\rho^4 + \dots)$$

Adsorbed H_2

$$U_{\text{Adsorbate}} = U_0 + U_{\text{MOF}}$$

$$U_{\text{MOF}} = U_{\rho=0} + U'\rho + U''\rho^2 + \dots$$

$$\Delta\omega_{0 \rightarrow n} \propto n \frac{B_e}{\omega_e} (U'' - 3aU') + O\left(\frac{B_e}{\omega_e}\right)^2$$

Frequency Shift Fundamental versus Overtone

$$\frac{\Delta\omega_{0\rightarrow n}}{\omega_e} \propto n \frac{B_e}{\omega_e^2} (U'' - 3a U')$$

$$\Delta\omega_{0\rightarrow 2} = 2 \Delta\omega_{0\rightarrow 1}$$

$$\frac{B_e}{\omega_e^2} \approx \text{constant for diatomic}$$

Fractional frequency shift for all isotopologues and overtones should be the same.

t = 17 min 
t = 42 min 
t = 550 min 

Fundamental

Overtone

InGaAs Detector plus filter

Relative Intensity of Q(0) and Q(1)

Why is the relative intensity of the Q(0) to Q(1) greater in the overtone than in the fundamental?

Two Induction Mechanisms

$$\vec{\mu}_{sys} = \vec{\mu}_{polar} + \vec{\mu}_{quad}$$

$$\vec{\mu}_{polar} = \vec{E}_{MOF} \cdot \alpha_{H_2}$$

$$\vec{\mu}_{quad} = \sum_i \vec{E}_{Q_H} \cdot \alpha_{i,MOF}$$

$$I_{0JM \rightarrow \nu' J' M'} \propto | \langle 0JM | \vec{\mu}_{sys} | \nu' J' M' \rangle |^2 =$$
$$| C \langle 0JM | \alpha_{H_2} | \nu' J' M' \rangle + D \langle 0JM | Q | \nu' J' M' \rangle |^2$$

Relative Intensity

Polarizability

BOTH

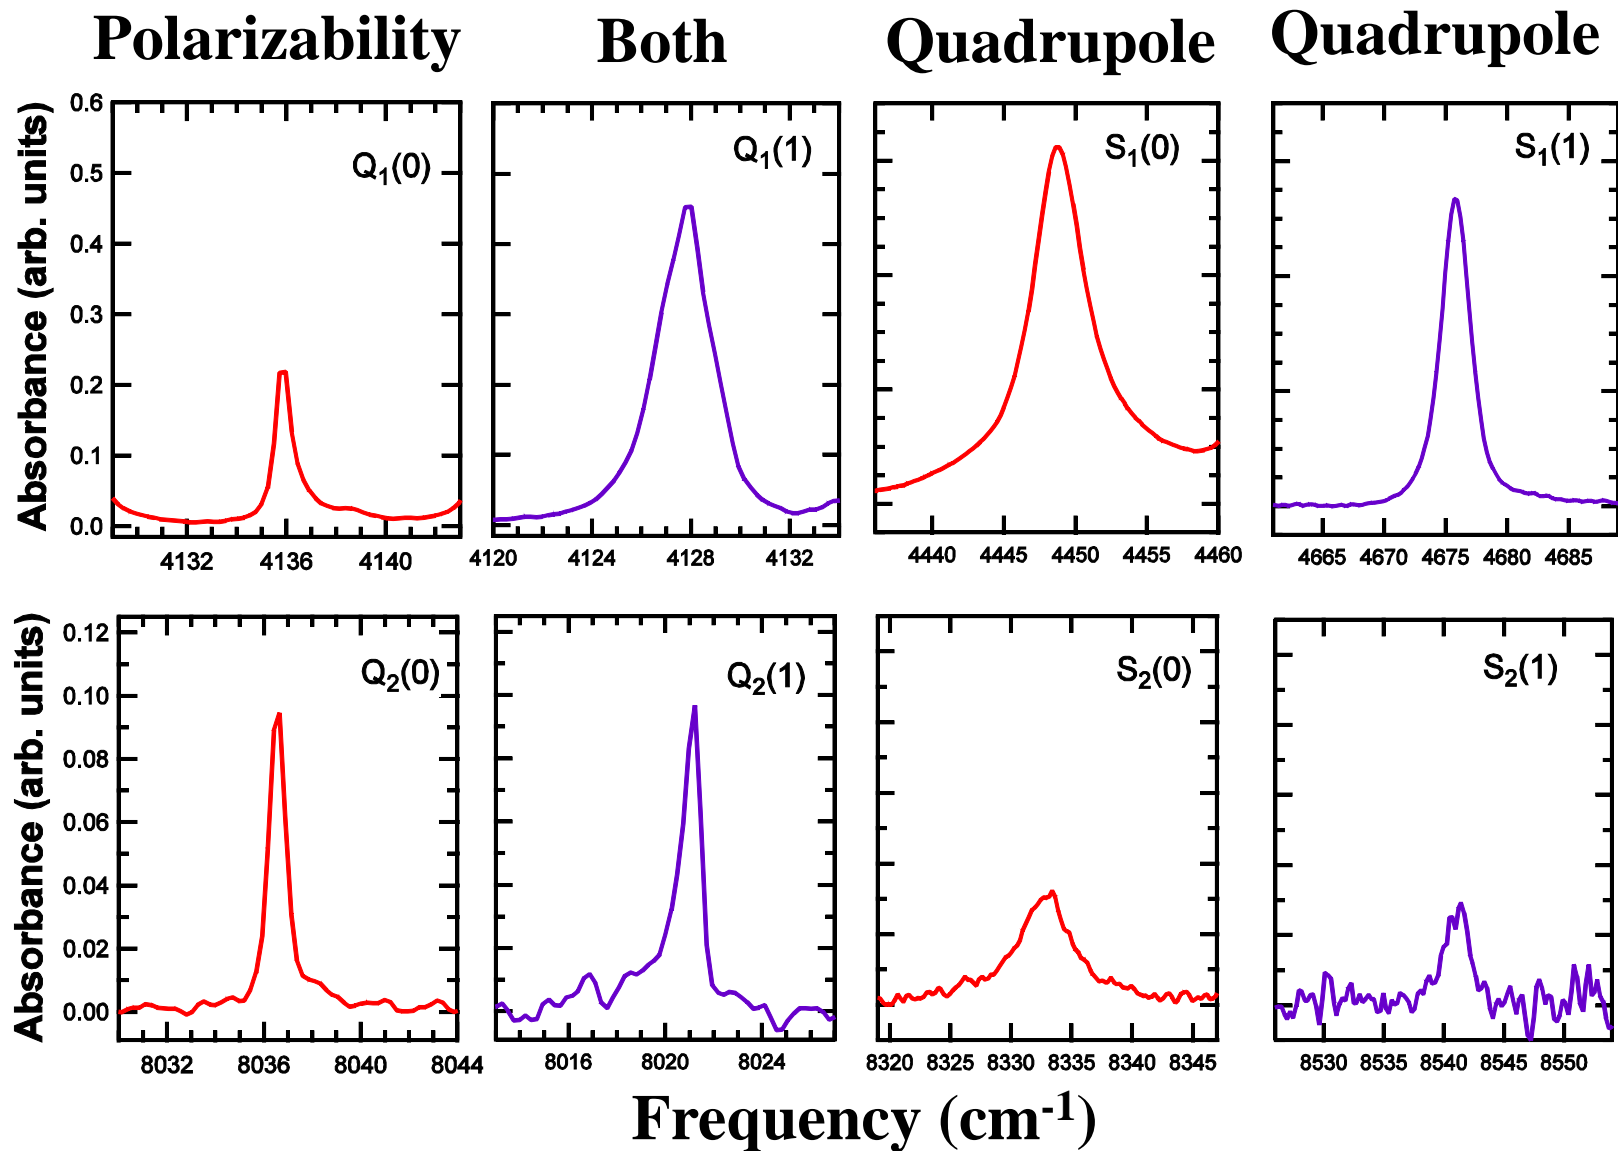

Fundamental

Overtone

Frequency (cm⁻¹)

Relative Intensity

Experimental Intensities

	Vibrational		Rovibrational $\Delta J = 2$	
	$Q(0)$	$Q(1)$	$S(0)$	$S(1)$
Mechanism	Polar	Both	Quad	Quad
$I_{2\leftarrow 0}/I_{1\leftarrow 0}$ (Theory)	1/60	$(C(1/8) + D(1/5))^2$	1/20	1/20
$I_{2\leftarrow 0}/I_{1\leftarrow 0}$ (MOF-5 Exp)	1/(2.5 \pm 0.5)	1/(14 \pm 3)	1/(17 \pm 1)	1/(22 \pm 4)

It appears that the polarizability mechanism is enhanced by more than an order of magnitude relative to gas phase, but quadrupole induction mechanism is largely unchanged.

Q(0) Relative Intensity Overtone vs Fundamental

$$\frac{I_{0 \rightarrow 2}}{I_{0 \rightarrow 1}} = \frac{B_e}{\omega_e} \left(a + \frac{\bar{\alpha}''}{\bar{\alpha}' } \right)^2$$

in gas phase $a = -1.607$ and $\frac{\bar{\alpha}''}{\bar{\alpha}' } = 0.537$

For MOF-5 would need $\left(a + \frac{\alpha''}{\alpha'} \right)^2 \approx 30$

Translational Peaks ?

Fundamental shifted by $\sim 3900 \text{ cm}^{-1}$ and $\times 0.35$

Conclusion

- **Overtone IR spectroscopy is a useful tool in studying adsorbed gas behavior**
- **Leads to peaks away from background**
Adds another site specific tool
Greatly facilitates in ortho/para studies
- **Relative intensity of overtone peaks provides detailed information about adsorbate**
- **Theoretical models are needed**
